

Pipe Relining

Hix Plumbing Services offers a wide variety of drainage repair options, including drainage **Pipe Relining**.

This process is one of the most efficient, cost effective and least intrusive. In a majority of situations no digging is required which allows the permanent repair to be undertaken without extensive damage to landscaping, concrete pathways and driveways and expensive remedial work that is usually required when large scale excavation occurs.

Pipe relining also allows for drainage repairs to be carried out in difficult situations where demolition of concrete slabs or even bathrooms would normally occur to gain access to the drainage under the floor. The system allows us to access drainage repair locations with out creating additional cost to our valued clients in relation to re instatement of gardens, driveways, pathways or most landscaped situations. This also includes areas requiring repair in large commercial situations where larger concrete or paved areas have been laid over the top of the drainage pipework, such as office buildings, large residential strata complexes or industrial and commercial factory complexes & government sites

We are also able to reline downpipes and above ground drainage stack work that may be in situations making it inaccessible & to offer better methods of carrying out permanent, long term drainage repairs.

What is Pipe Relining?

The process is technical and requires skilled and trained technicians to carry out the works. Using specialised equipment The process is primarily inserting a resin impregnated liner into the existing damaged drainage line, then curing the resin and liner within the pipe using compressed air and hot water to form a new pipe with in the old drainage . The Relined section is genuinely stronger and more resilient than the existing drainage materials such as Clay pipe and PVC. The process can be carried out in small sectional repairs or long continuous runs.
